Introduction	9
I Activation study using neutron-equivalent sources	14
1 Physics for shielding studies	15
1.1 General principles	15
1.2 Proton interactions	18
1.3 Neutron interactions	26
1.4 Spallation reaction	29
1.5 Monte Carlo principle	42
2 Monte Carlo simulations for the activation of concrete shieldings	46
2.1 Tools for the computation of activity concentration	47
2.2 Methodology to compute the activity concentration	53
2.3 Benchmarking of spallation models in Monte Carlo softwares	55
2.4 Activation computation of a Proteus One	60
2.5 Reduction of activated concrete in a Proteus One	71
2.6 Conclusion	73
II Optimisation and reduction of the neutrons production by the energy degrader	74
3 Beam dynamics and beam transport formalism	75
3.1 Elements of classical mechanics for beam physics	75
3.2 Fundamentals in particle beam dynamics	78
3.3 Beam transport and modeling codes	93
4 Detailed study of energy degraders toward innovative design for therapeutic beams	99
4.1 Objectives	99
4.2 Tools and methods	102
4.3 Comparison of materials for degrader using synthetic geometry	110
4.4 Realistic simulation of the <i>IBA</i> degrader and collimator	114
4.5 Study and performance reach for a diamond-based degrader	120
4.6 Conclusion	122

III	Complete installation simulation using BDSIM	123
5	Modelisation of the transport beamline	124
5.1	Beam transport model for the Proteus One system	125
5.2	Experimental validation of the Monte Carlo Proteus One model.	133
5.3	Conclusion	139
6	BDSIM model for the activation of a Proteus One system	140
6.1	Validation of the neutron-equivalent source method	141
6.2	Evaluation of the concrete shielding activation of a Proteus One using BDSIM	142
6.3	Neutron and proton maps in a Proteus One system	145
6.4	Conclusion	147
	Conclusion	150
