Contents

List of Figures **XI**

List of Tables **XXI**

Nomenclature **XXIII**

1 Introduction **1**

1.1 Motivation and objectives 1

1.2 State of the art in ABL turbulence modelling 3

1.3 State of the art in ABL dispersion modelling 6

1.4 Structure of the thesis 8

1.5 Software employed 9

2 CFD turbulence modelling **11**

2.1 Governing equations for RANS 13
2.1.1 Transport equations and closure problem 14
2.1.2 The standard $k-\epsilon$ turbulence model in ABL 15
2.1.3 Wall treatment 19
2.1.4 Disturbed flow-field: definition of a Building Influence Area . 23
2.2 Governing equations for LES 34
2.3 Governing equations for DES 36
2.4 Influence of stability classes 38
2.4.1 General turbulence Model 42
2.4.2 Turbulence in homogeneous ABL 43
2.4.3 Inlet boundary conditions 44

3 CFD dispersion modelling **47**
3.1 Governing equations 56
3.2 Uncertainty Quantification 60
3.3 Feature-extraction using principal component analysis 63

4 Modelling flow field in wind tunnel and real-scale applications **69**
4.1 Neutral atmospheric boundary layer 70
4.1.1 Empty fetch at full scale 70
4.1.2 Flow around a ground-mounted building - Cedval A1-1 . . . 73
4.1.3 Flow around an array of obstacles - Cedval B1-1 95
4.1.4 Single high-rise building - Case B 103
4.1.5 Shinjuku district - Case F 109
4.2 Non-neutral atmospheric boundary layer 118

4.2.1 Simplified 3D hill 118

5 Dispersion in simplified ABL test cases 131

5.1 Cedval A1-5 Single Building 134

5.1.1 Uncertainty Quantification study for the dispersion parameters 135

5.1.2 Data from high-fidelity dDES 139

5.1.3 Correlation study and feature-extraction 143

5.1.4 Model calibration based on empirical relations 147

5.1.5 Derivation of a generalized Sc_t formulation with MG-PCA . . 151

5.1.6 Results for the A1-5 Single Building test case 155

5.2 Cedval B1-1 Array of Buildings 167

5.3 Isolated cubic building 174

5.4 CODASC Empty street canyon 177

6 Conclusions and perspectives 181

6.1 Conclusions for ABL turbulence modelling 181

6.2 Conclusions for ABL dispersion modelling 183

6.3 Future perspective 184

Appendices 185

A Impact of urban environment on Savonius wind turbine performance 187

A.1 Urban Modelling Guidelines 189

A.1.1 Grid and GCI analysis 191

A.2 Flow pattern around and over the target building 193

A.2.1 Methods and Algorithms . . . 193
A.2.2 Base-Case Results . . . 193
A.2.3 Sensitivity Analysis . . . 196
A.2.4 Sampling for Turbine Simulations . . . 198
A.3 Turbine Analysis . . . 201
A.3.1 Mesh and Turbulence Modelling . . . 201
A.3.2 Results . . . 203

B Prediction and mitigation of traffic-related air pollution hotspots 209
B.1 Available local mitigation measures . . . 210
B.2 Turnhoutsebaan: measurements and modelled site . . . 212
B.2.1 Selected meteorological conditions . . . 212
B.2.2 Traffic data and pollutant emissions . . . 212
B.2.3 Estimation of the pollutant background concentration . . . 215
B.2.4 Wind measurements in the domain of interest . . . 217
B.2.5 PM_{10} concentration measurements in the domain of interest 219
B.2.6 Computational domain, settings and grid . . . 220
B.3 Results and discussion . . . 224
B.3.1 Analysis of flow field, pollutant level and distribution . . . 224
B.3.2 Investigated mitigation measures . . . 230

C Wind comfort study for the Grand Place 243
C.1 Area and geometry of the case study . . . 243
C.2 Computational domain, grid and settings . . . 246
C.3 Results for the velocity field . . . 248

D Comparison of outcomes: Fluent and OpenFOAM **255**

List of Publications **261**

Bibliography **263**
