

Statistical biophysics of hematopoiesis and growing cell populations

Nathaniel Vincent Mon Père

Contents

1. Introduction	11
I. Population dynamics of hematopoiesis	19
2. Hematopoiesis: the factory for blood	21
2.1. A brief history of hematopoiesis	22
2.2. Cellular differentiation	25
2.2.1. Providing variety and specification	25
2.2.2. Transitional states and cell fate	28
2.2.3. The role of cell divisions in differentiation	30
2.3. Hematopoietic lineages	31
2.4. Hematopoietic stem cells	31
2.5. Differentiation tissues accumulate mutations	33
2.6. Open questions and perspectives	34
3. Mathematical tools	37
3.1. Stochastic processes	37
3.1.1. The Bernoulli process	38
3.1.2. The Poisson process	40
3.2. Markov Chains	46
3.2.1. The state space	47
3.2.2. Markov transition probabilities	48
3.2.3. Discrete time Markov chains	49

Contents

3.2.4.	Continuous time Markov chains	50
3.2.5.	Non-discrete state spaces	50
3.3.	Stochastic population dynamics with Markov chains	51
3.3.1.	The birth-death process	51
3.3.2.	The Moran process	53
3.4.	summary	55
4.	Hematopoietic stem cells: a neutral stochastic population	57
4.1.	The importance of stochasticity	59
4.2.	Assumptions for stochastic HSC dynamics	60
4.2.1.	Mutation rate	64
4.2.2.	Division rate	64
4.3.	Modeling the stochastic dynamics of a mutant clone	65
4.3.1.	A birth-death model (is not sufficient)	65
4.3.2.	A Moran model	67
4.3.3.	Moving to real time	68
4.3.4.	The diffusion approximation	69
5.	Evolutionary dynamics of paroxysmal nocturnal hemoglobinuria	73
5.1.	Paroxysmal nocturnal hemoglobinuria	73
5.2.	Applying the Moran model	76
5.2.1.	Transition probabilities	76
5.2.2.	Ontogenic growth	78
5.2.3.	Observing multiple clones	78
5.2.4.	Parameter values and diagnosis threshold	80
5.3.	Results and predictions	82
5.3.1.	Probability and prevalence of PNH	82
5.3.2.	Average clone sizes	85
5.3.3.	Arrival times of mutated clone and clinical PNH	85
5.3.4.	Clonal expansion	86

5.3.5. Disease reduction	88
5.4. Discussion	89
5.5. Perspective: HSCs under perturbed hematopoiesis	91
5.5.1. Feedback driven division rates	92
5.5.2. Heuristic results	93
5.6. Conclusion	96
6. Subclonal dynamics in hematopoietic stem cells	97
6.1. Clonality	98
6.2. Moran model with asymmetric divisions	100
6.3. Testing with simulations	103
6.4. The single cell mutational burden	104
6.4.1. Mutational burden as a compound Poisson process	104
6.4.2. Markov chain approach	106
6.4.3. Discussion: single cell mutational burden	108
6.5. The variant allele frequency spectrum (VAF)	109
6.5.1. Dynamics of the VAF expected value	110
6.5.2. Dynamics of the VAF variance	111
6.5.3. Equilibrium distributions	116
6.5.4. Discussion: VAF	116
6.6. The sampling problem	118
6.7. Applications to a human HSC dataset	121
6.7.1. Data: somatic mutations in single HSCs	121
6.7.2. Single cell mutational burden	122
6.7.3. Variant allele frequency spectrum: fitting parameters with Approximate Bayesian Computation	122
6.7.4. Discussion: applications to a dataset	127
6.8. Conclusions and perspective	127

7. Feedback-driven compartmental dynamics of hematopoiesis	129
7.1. A compartmental model of hematopoiesis	132
7.1.1. Dingli model	132
7.1.2. Introducing feedback	134
7.2. Analysis	136
7.2.1. Sequential coupling elicits three types of behavior	136
7.2.2. Increasing cell amplification between compartments reduces stability	138
7.2.3. Recovery time as a measure of efficiency	140
7.2.4. Inclusion of feedback allows prediction of erythrocyte dynamics . .	140
7.2.5. Chronic perturbations lead to new equilibrium states	143
7.3. Discussion and conclusions	144
II. Statistical mechanics of proliferating cells	167
8. Cell movement as a stochastic process	169
8.1. Motility in cancer: a motivating example	171
8.2. Cells as motile particles	175
8.3. Basics of stochastic motion	176
8.3.1. Brownian motion	177
8.3.2. Generalizations and other models	183
9. Stochastic motion under population growth	185
9.1. The problem of growth	185
9.2. Brownian motion in an ideal gas	186
9.2.1. Velocity correlation of the random walk	187
9.3. Coupling the Brownian Langevin equation to the particle density	189
9.3.1. Fixed density populations	189
9.3.2. Growing populations	190
9.3.3. Alternative types of motion	191

9.4. Comparison of the Langevin equation with direct particle simulations . . .	192
9.4.1. Fixed density results	193
9.4.2. Growing population results	198
9.5. Perspective: localizing the LE for interacting particles	198
9.6. Discussion	200
10. Conclusions	213
10.1. Population dynamics of hematopoiesis	213
10.2. Statistical mechanics of proliferating cells	217
A. Population dynamics of hematopoiesis	221
A.1. Combining Poisson processes	221
A.2. Simulations of the Moran model with mutant accumulation	222
A.2.1. The cell population	223
A.2.2. Events which alter the population	223
A.2.3. Mutations	224
A.2.4. Time evolution	224
A.3. Obtaining the mean and variance of the compound Poisson distribution	224
A.4. Compartment model of hematopoiesis: fixing parameter values	225
B. Statistical mechanics of cell motion	227
B.1. Particle simulation	227
B.1.1. Particle properties	227
B.1.2. Particle collisions	228
B.1.3. Confined space: minimum image periodic boundaries	228
B.1.4. Accounting for center of mass drift	228
B.1.5. Population growth	229
B.1.6. Sketch of the simulation algorithm	229
B.2. Numerically simulating the Langevin equation	230
