

# Table of Contents

<b>Nomenclature</b>	<b>xiii</b>
<b>1 Introduction</b>	<b>1-1</b>
1.1 Atmospheric entry	1-1
1.1.1 The problem of aerodynamic heating	1-4
1.2 Boundary-layer transition in high-speed flow	1-7
1.2.1 The role of isolated roughness elements on boundary-layer transition	1-10
1.2.2 High-enthalpy effects on boundary-layer transition	1-15
1.3 Thesis scope and structure	1-16
References	1-19
<b>2 Governing equations</b>	<b>2-1</b>
2.1 Thermodynamic flow assumptions	2-1
2.1.1 Calorically perfect gas (CPG)	2-2
2.1.2 Thermally perfect gas (TPG)	2-3
2.1.3 Mixture of perfect gases in chemical non-equilibrium (CNE)	2-4
2.2 Navier-Stokes equations	2-4
2.2.1 Calorically perfect gas	2-5
2.2.1.1 Non-dimensional form	2-6
2.2.2 Thermally perfect gas	2-9
2.2.3 Mixture in chemical non-equilibrium	2-9
2.3 Boundary conditions	2-10
2.3.1 Wall boundary conditions	2-11
2.3.2 Inflow boundary conditions	2-11
2.3.3 Outflow boundary conditions	2-12
2.3.4 Symmetry boundary conditions	2-12
2.4 Boundary-layer equations	2-13
2.4.1 Calorically and thermally perfect gas	2-13
2.4.1.1 Self-similar solution for a flat plate	2-14
2.4.2 Mixture in chemical non-equilibrium	2-16
2.5 Modeling of gas properties	2-17
2.5.1 Thermal properties	2-17
2.5.2 Transport properties	2-18
2.5.2.1 Sutherland's law	2-18

2.5.2.2	Gupta-Wilke model . . . . .	2-20
2.5.2.3	Constant Schmidt number diffusion model . . . . .	2-21
2.5.3	Chemical properties . . . . .	2-22
2.5.3.1	Law of mass action . . . . .	2-23
2.5.3.2	Calculation of the equilibrium constant . . . . .	2-23
	References . . . . .	2-25
<b>3</b>	<b>Hydrodynamic stability</b>	<b>3-1</b>
3.1	Linearized perturbation equations . . . . .	3-2
3.2	Treatment of the perturbations of the dependent quantities . . . . .	3-2
3.3	Fourier transformation of the perturbation quantities . . . . .	3-3
3.4	Local linear stability theory . . . . .	3-6
3.4.1	Parallel flow assumption . . . . .	3-6
3.4.2	Temporal stability framework . . . . .	3-7
3.4.3	Spatial stability framework . . . . .	3-7
3.4.4	Approximate relation between temporal and spatial growth rates . . . . .	3-9
3.5	Non-local linear stability theory: parabolized stability equations . . . . .	3-10
3.5.1	Definition of growth rate . . . . .	3-12
3.6	Extensions for base flows with additional inhomogeneous directions . . . . .	3-12
3.6.1	Two-dimensional local linear stability theory . . . . .	3-13
3.6.1.1	Parallel flow assumption revisited . . . . .	3-14
3.6.2	Streamwise BiGlobal stability theory . . . . .	3-15
3.6.3	Three-dimensional parabolized stability equations . . . . .	3-16
3.6.4	TriGlobal stability theory . . . . .	3-17
3.7	The $e^N$ method for transition prediction . . . . .	3-18
3.8	Accounting for non-linearities . . . . .	3-19
3.9	Boundary conditions for the perturbation quantities . . . . .	3-20
3.9.1	Wall boundary . . . . .	3-20
3.9.2	Wall-normal far-field boundary . . . . .	3-22
3.9.3	Periodic spanwise boundaries . . . . .	3-23
3.9.4	Symmetric spanwise boundaries . . . . .	3-23
3.10	Disturbance energy evolution equation for a calorically perfect gas . . . . .	3-24
3.10.1	The disturbance energy definition of Chu . . . . .	3-25
3.10.1.1	Chu's disturbance energy evolution equation for base flows depending on $y$ and $z$ . . . . .	3-26
3.10.1.2	Chu's total disturbance energy definition in terms of $\tilde{p}$ and $\tilde{s}$ . . . . .	3-30
3.10.2	Decomposition of the temporal growth rate for two-dimensional local linear stability theory . . . . .	3-30
3.11	Convective and absolute instabilities . . . . .	3-35
3.12	Non-modal growth . . . . .	3-36
3.12.1	Formulation according to the 2D-LST initial value problem . . . . .	3-37
3.13	Pseudospectra . . . . .	3-41
3.14	Data-driven analysis of flow instabilities . . . . .	3-41

3.15	Modal instabilities evolving in a smooth flat-plate boundary layer at high speed . . . . .	3-43
3.15.1	Topology of first- and second-mode instabilities in the 2D-LST spectrum . . . . .	3-44
	References . . . . .	3-47
<b>4</b>	<b>Numerical methodology</b>	<b>4-1</b>
4.1	Base-flow computation . . . . .	4-1
4.1.1	Solution of the boundary-layer equations . . . . .	4-2
4.1.2	The DEKAF flow solver . . . . .	4-2
4.1.3	Solution of the Navier-Stokes equations . . . . .	4-3
4.1.3.1	The Navier-Stokes solver in CFD++ <sup>®</sup> . . . . .	4-3
4.1.3.2	Grid generation . . . . .	4-4
4.2	Stability analysis . . . . .	4-5
4.2.1	Spatial discretization techniques . . . . .	4-5
4.2.1.1	Chebyshev collocation method . . . . .	4-6
4.2.1.2	High-order finite difference method by Hermanns & Hernández [19] . . . . .	4-9
4.2.2	Mapping techniques . . . . .	4-12
4.2.2.1	Mapping proposed by Malik [28] . . . . .	4-12
4.2.2.2	Biquadratic mapping . . . . .	4-13
4.2.2.3	Transformation of the differentiation matrices to the physical domain . . . . .	4-14
4.2.2.4	Interpolation of base-flow quantities on the mapped collocation grid . . . . .	4-15
4.2.3	Integration techniques . . . . .	4-16
4.2.3.1	Integration by means of Chebyshev integral weight functions . . . . .	4-16
4.2.3.2	Integration using the inverse of part of the differentiation matrices . . . . .	4-17
4.2.4	Calculation of base-flow derivatives . . . . .	4-18
4.2.5	Numerical implementation of boundary conditions for the perturbation quantities . . . . .	4-22
4.2.5.1	Homogeneous Dirichlet conditions . . . . .	4-23
4.2.5.2	Homogeneous Neumann conditions . . . . .	4-23
4.2.5.3	Periodic conditions . . . . .	4-24
4.2.5.4	Compatibility conditions . . . . .	4-24
4.2.5.5	Treatment at domain corners . . . . .	4-25
4.2.6	Algorithms for the solution of the generalized eigenvalue problem . . . . .	4-25
4.2.6.1	QZ algorithm . . . . .	4-25
4.2.6.2	Implicitly restarted Arnoldi method . . . . .	4-26
4.2.7	Algorithms to compute the evolution of a single eigenvalue/eigenvector pair . . . . .	4-29
4.2.7.1	Newton-Raphson iteration . . . . .	4-30

4.2.7.2	Generalized Rayleigh quotient iteration . . . . .	4-30
4.3	VESTA toolkit . . . . .	4-32
4.3.1	Automatic derivation and implementation tool (ADIT) . . . . .	4-32
4.3.2	The 2D-LST/BiGlobal solver . . . . .	4-34
	References . . . . .	4-36
<b>5</b>	<b>Stability analysis of the wake behind an isolated roughness element in a calorically perfect gas</b>	<b>5-1</b>
5.1	Problem description . . . . .	5-1
5.1.1	Roughness geometries . . . . .	5-3
5.2	Instabilities induced by a cuboidal roughness element at a fixed streamwise location and frequency . . . . .	5-3
5.2.1	Geometrical parameters and definition of different test cases	5-4
5.2.2	Computational grid employed for the base flow calculations	5-9
5.2.3	Base-flow solutions . . . . .	5-10
5.2.4	Spatial stability spectrum . . . . .	5-15
5.2.4.1	Effect of the self-similar boundary-layer assumption at the domain inflow . . . . .	5-22
5.2.4.2	Effect of the flat plate leading-edge bluntness . . . . .	5-23
5.2.4.3	Effect of the thermal wall boundary condition . . . . .	5-23
5.3	Streamwise evolution of the instabilities induced by a cuboidal and a ramp-shaped roughness element . . . . .	5-27
5.3.1	Geometrical parameters and case definition . . . . .	5-27
5.3.2	Computational grids . . . . .	5-28
5.3.3	Base-flow solutions . . . . .	5-29
5.3.4	Temporal stability spectrum . . . . .	5-36
5.3.4.1	Convergence of the growth rate with respect to grid resolution . . . . .	5-44
5.3.4.2	Effect of the domain size on the stability spectrum	5-46
5.3.5	Streamwise evolution of the growth rate of the instabilities evolving in the roughness wake . . . . .	5-47
5.3.5.1	Evolution of Mack-mode instabilities modulated by the roughness wake . . . . .	5-47
5.3.5.2	Evolution of the leading sinuous and varicose instabilities . . . . .	5-49
5.3.5.3	Integrated amplification factors of the wake instabilities obtained by means of the Gaster transformation . . . . .	5-53
5.3.6	Temporal growth-rate decomposition of the instabilities behind the roughness elements . . . . .	5-57
5.3.6.1	Streamwise evolution of the temporal growth-rate decomposition . . . . .	5-67
5.3.7	Synchronism between wake instabilities and boundary-layer modes . . . . .	5-76
5.4	Summary of results . . . . .	5-81

---
